

## To change the user name in Linux:

1. check your user name

>whoami

2. Create a temporary user

>sudo adduser tempadmin

3. Add the new user to sudoers

> sudo usermod -aG sudo tempadmin

4. Logout from the current user via GUI and login to tempadmin

5. In the terminal of tempadmin,

>sudo usermod -l 1RV24MC089\_SAHANA\_H\_J sahana

6. Now type the below command in original user after logging again via GUI:

>whoami

```
1RV24MC089_SAHANA_H_J@sahana:~$ whoami
1RV24MC089_SAHANA_H_J
1RV24MC089_SAHANA_H_J@sahana:~$
```

7. Remove the temp user,delete it

>sudo deluser tempadmin

>sudo rm -r /home/tempadmin

```
1RV24MC089_SAHANA_H_J@sahana:~$ sudo deluser tempadmin
sudo rm -r /home/tempadmin
[sudo] password for 1RV24MC089_SAHANA_H_J:
info: Removing crontab ...
info: Removing user 'tempadmin' ...

1RV24MC089_SAHANA_H_J@sahana:~$ sudo deluser tempadmin
info: Removing crontab ...
info: Removing user 'tempadmin' ...
1RV24MC089_SAHANA_H_J@sahana:~$ sudo rm -r /home/tempadmin
rm: cannot remove '/home/tempadmin': No such file or directory
```

## TO INSTALL DOCKER USING APT REPO

### 1. Set up Docker's apt repository.

# Add Docker's official GPG key:

```
sudo apt-get update
```

```
sudo apt-get install ca-certificates curl
```

```
sudo install -m 0755 -d /etc/apt/keyrings
```

```
sudo curl -fsSL https://download.docker.com/linux/ubuntu/gpg -o /etc/apt/keyrings/docker.asc
```

```
sudo chmod a+r /etc/apt/keyrings/docker.asc
```

# Add the repository to Apt sources:

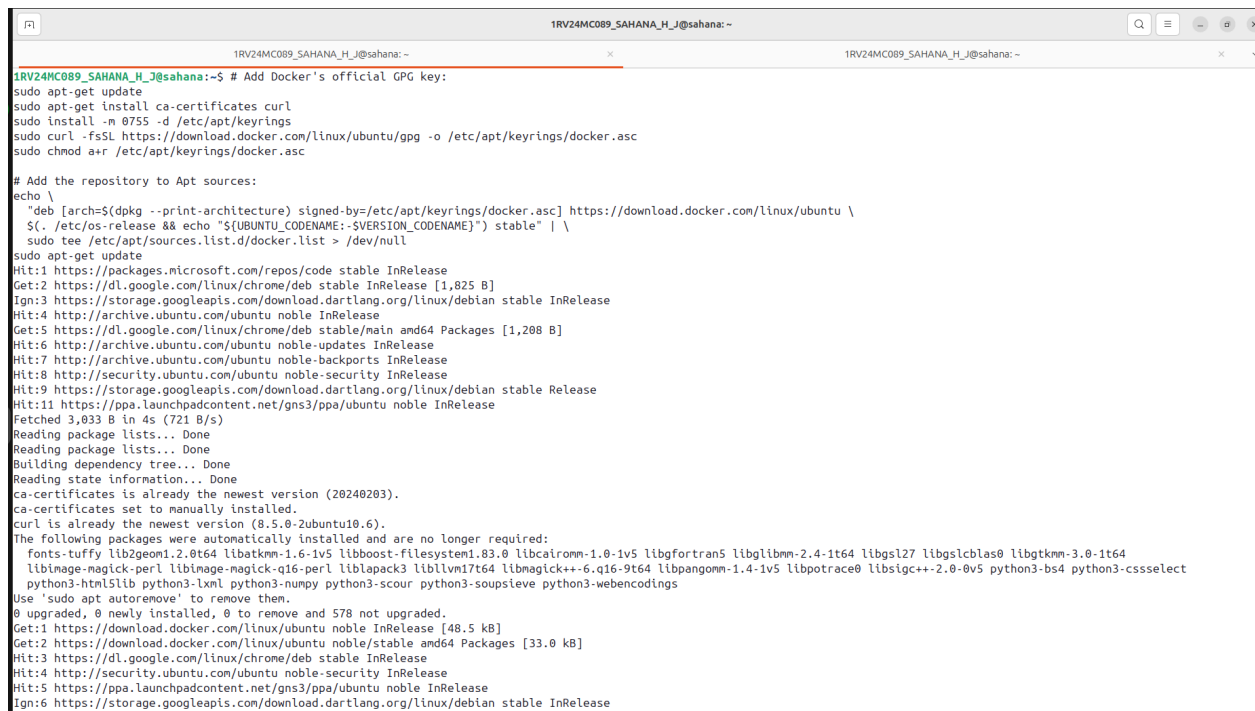

```
echo \
```

```
"deb [arch=$(dpkg --print-architecture) signed-by=/etc/apt/keyrings/docker.asc] https://download.docker.com/linux/ubuntu \
```

```
$(. /etc/os-release && echo "${UBUNTU_CODENAME:-$VERSION_CODENAME}") stable" | \
```

```
sudo tee /etc/apt/sources.list.d/docker.list > /dev/null
```

```
sudo apt-get update
```

```
1RV24MC089_SAHANA_H_J@sahana: ~
1RV24MC089_SAHANA_H_J@sahana: ~$ # Add Docker's official GPG key:
sudo apt-get update
sudo apt-get install ca-certificates curl
sudo install -m 0755 -d /etc/apt/keyrings
sudo curl -fsSL https://download.docker.com/linux/ubuntu/gpg -o /etc/apt/keyrings/docker.asc
sudo chmod a+r /etc/apt/keyrings/docker.asc

# Add the repository to Apt sources:
echo \
"deb [arch=$(dpkg --print-architecture) signed-by=/etc/apt/keyrings/docker.asc] https://download.docker.com/linux/ubuntu \
$(. /etc/os-release && echo "${UBUNTU_CODENAME:-$VERSION_CODENAME}") stable" | \
sudo tee /etc/apt/sources.list.d/docker.list > /dev/null
sudo apt-get update

### 4. Run a sample container

```
1RV24MC089_SAHANA_H_J@sahana:~$ sudo docker run hello-world
[sudo] password for 1RV24MC089_SAHANA_H_J:
Unable to find image 'hello-world:latest' locally
latest: Pulling from library/hello-world
17eec7bbc9d7: Pull complete
Digest: sha256:6dc565aa63092705211f823c303948cf83670a3903ffa3849f1488ab517f891
Status: Downloaded newer image for hello-world:latest
```

Hello from Docker!  
This message shows that your installation appears to be working correctly.

To generate this message, Docker took the following steps:

1. The Docker client contacted the Docker daemon.
2. The Docker daemon pulled the "hello-world" image from the Docker Hub. (amd64)
3. The Docker daemon created a new container from that image which runs the executable that produces the output you are currently reading.
4. The Docker daemon streamed that output to the Docker client, which sent it to your terminal.

To try something more ambitious, you can run an Ubuntu container with:  
\$ docker run -it ubuntu bash

Share images, automate workflows, and more with a free Docker ID:
