Lab Program 6

Title: Deploy an automated build pipeline using Docker Hub

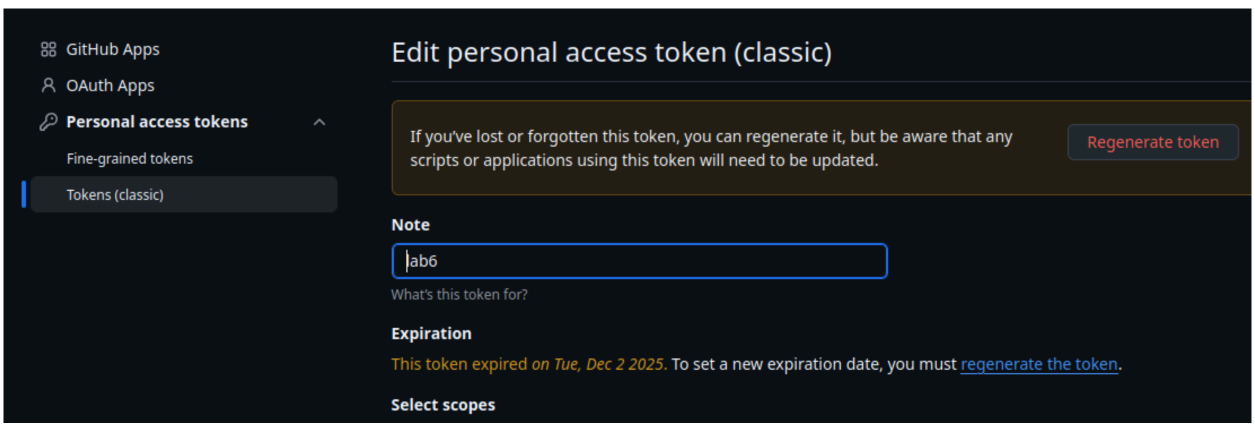
prog6/

Dockerfile
package.json
package-lock.json
node_modules

STEP 1: Create Github Personal Access Token

Login to github > settings > developer settings > personal access tokens > Tokens(classic) > give name and expiry date > check write packages and read packages

Create and copy the pat



STEP 2: Create a Dockerfile and build the image

$ docker build -t p6 .

STEP 3: Tag the image for Docker Hub

docker tag p6 <username>/p6:latest

```
bittersteel/p6:latest          ba4988dcb707     132MB     0B
```

STEP 4: Push the image to Docker Hub
$ docker login -u <dockerhub_username>
Enter PAT generated. If already setup continue

$ docker push <dockerhub_username>/p6:latest

```
victus% docker push bittersteel/p6:latest
The push refers to repository [docker.io/bittersteel/p6]

```

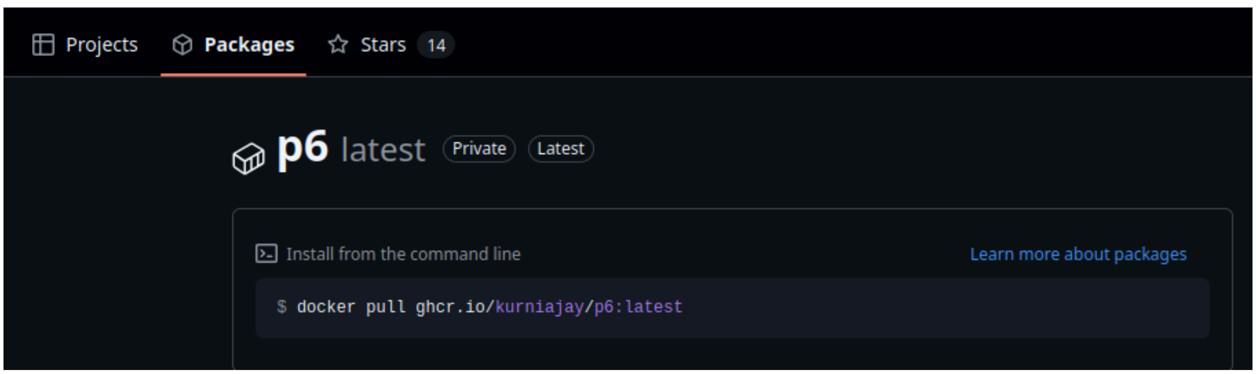
STEP 5: Tag the image for Github Container Registry (GHCR)
$ docker tag p6 ghcr.io/<github_username>/p6:latest

STEP 6: Connect local project to Github (source code)
Create Github repository 6.git
$ git remote add origin https://github.com/kurniajay/p6.git

STEP 7: Push source code to Github
In Local project directory
$ git init
$ git add .
$ git commit -m “Initial commit”
$ git branch -M main
$ git push -u origin main

STEP 8: Verify uploads on both Registories
Github:

Navigate to Packages under your profile to check the image



Docker Hub:
